

Hardware Requirements

- [Windows](#)
- [Android](#)
- [iOS](#)

Windows

The following requirements apply for running the client on Windows:

1. DeDeSales is a UWP application.
2. Microsoft Windows 10 or higher.

The requirements for CPU, storage space and memory strongly depend on the quantity of data to be processed, so we cannot give a recommendation here. However, we recommend testing various devices during the project phase and then deciding what best suits your requirements.

Android

The following requirement applies for operation on Android:

1. Android 5 (API Level 21, Lollipop)

Basically, it should be said about Android that you should select one of the most powerful Devices when purchasing.

iOS

The devices should correspond to the current standard. Assume that devices that are 4 Years old or older cannot provide the necessary performance.

Furthermore, ensure that you allocate enough storage space on the devices for Pictures. A subsequent increase in storage is not possible on these devices.

The following requirements apply for use on an iPad or iPhone:

1. Apple Business Manager
2. If you manage your Employee accounts via the Apple Business Manager, an MDM system is an essential prerequisite. If the Employee accounts are not assigned to the Apple Business Manager, you must generate redemption codes in the Apple Business Manager and distribute them independently to your Employees.
